

SAP JOINS JIRA

Overview

Challenges

- Visualization of tasks
- Tracking and documentation
- Creation of transparency and progress

Customer benefits

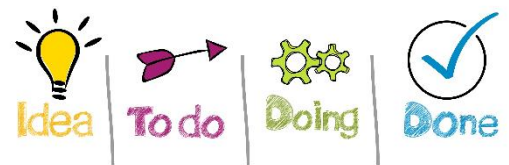

- Bidirectional interface
- Out-of-the-box solution
- Usage of standardized interfaces
- Enhancements and adjustments via Customizing
- No additional middleware necessary
- Flexibly adaptable to your application or scenario

Requirements

- ABAP 7.40 – lower releases on request
- > JIRA 7.0.0

The challenge

Change will never again be as slow as it is today. In order to maintain an overview in this environment, suitable methods and technologies are needed. JIRA has established itself in project, requirements, task and process management. Link your SAP landscape with JIRA to keep up with change.

Your benefit

Establish bidirectional communication between your SAP landscape and your JIRA instances. This creates a reciprocal effect: Actions in the respective systems can be linked with each other in almost any way. Only standardized interfaces are used and the enhancements and adjustments can be made easily via customizing. BRF+ decision tables provide you with a powerful tool for making settings. You do not need any additional middleware. Enjoy maximum freedom and adapt the workflows in both worlds to each other. Every SAP module is supported and can be operated by our core interface.

Combine the best of both worlds

Create the necessary transparency in your projects and processes. Improve quality by tracking the previous progress and current status of a task. Provide your employees with a tool that supports them in their daily work and automates workflows.
